

Geographical Information Systems (GIS) are an effective tool for Lands Governance under the *Framework Agreement for First Nations Land Management*.

The Planning Hub's GIS Specialist will assist our signatory communities with challenges related to planning, design and maintenance of their GIS under land governance.

Specific GIS Support

The GIS Specialist can assist you in multiple ways, including:

- general troubleshooting and support
- advice on software and equipment purchases* and compatibility issues
- converting hard copy value added data into digital mapping layers
- integrating and overlaying planning information into GIS

** RC will not make equipment or software recommendations, but instead will assist in choosing the right system for the community's needs.*

Integrating FNLRS Data

Provide advice and support on how to integrate exported data from the First Nations Land Registry System (FNLRS) into a cadastral layer in GIS. RC can also assist in identifying and importing other electronic land inventory data into GIS that is relevant to Lands Governance needs.

GIS Standards

Assistance with the development of a community focused GIS manual used to identify specific mapping protocols, projections, symbology, design and data quality control procedures to enhance and support a community's Lands Governance system.

Data Library

Assistance in the design and organization of an electronic land inventory and optimizing data integration to use as a key tool across the organization for managing Lands Governance initiatives.

GIS Needs Assessment

Direct community support to identify and review GIS resources that may assist the management of specific Lands Governance issues. As well as support in determining a type of system and software that might be most appropriate for your community.
